-!- TISSUB SPECIFICITY: PCSA is expressed in most tissues but is most abundant in the intestine and adrenals. PCSB is expressed in the intestine, adrenals and lung but not in the brain.
-!- DEVELOPMENTAL STAGS: Weakly expressed throughout the embryo, except in the developing nervous system, the ribs and the liver, but markedly upregulated at discrete sites during development. At B6.5, prominent expression observed in differenciated decidua. At B7.5, intense expression in extraembryonic endoderm, amnion and nascent mesoderm. At B8.5, abundant expression in somites and yolk sac followed by a confination to dermamyotome compartment. Between B9.5 and B11.5, abundant expression in ARR (thickened ectodermal cells of limb buds). At B12.5, expression in the limbs is confined to the condeminal manual procession in the limbs is confined to the condeminal manual procession in the limbs is confined to the condeminal manual procession in the limbs is confined to the condeminal manual procession in the limbs is confined to the condeminal manual man
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. "Murine subtilisin-like proteinase SPC6 is expressed during embryonic implantation, somitogenesis, and skeletal formation.";

Dev. Genet. 21:75-81(1997).

-! - FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RX(K/R)R consensus motif. May be responsible for the maturation of gastrointestinal peptides. May be involved in the cellular proliferation of adrenal cortex via the activation of growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     stage, strong expression also detected in vertebral and facial cartilage primordia and in the muscle of the tongue. At E16.5, abundant expression in epithelial cells of the intestinal villi. Isoform A is most abundant at all stages but significant levels of isoform B occur at E12.5.

DOMAIN: The propertide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic
                                                                                                                                                                                                                                                                                                                              of growth factors.

CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.

SUGCELLUTAR LOCATION: PCSA IS SECRETED THROUGH THE REGULATED SECRETORY PATHWAY. PCSB IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DOMAIN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Event=Alternative splicing; Named isoforms=2;
Comment=Additional isoforms seem to exist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: Belongs to peptidase family S8. SIMILARITY: Contains 1 homo B/P domain.

TISSUS SPECIFICITY: Rach PACE4 isoform exhibits a unique restricted distribution. PACE4A-1 is expressed in heart, brain, placenta, lung, skeletal muscle, kidney, pancreas, but at comparatively higher levels in the liver. PACE4A-II is at least expressed in placenta. PACE4B was only found in the embryonic kidney cell line from which it was isolated. PACE4C and PACE4D are placenta. PACE4E-I is expressed in cerebellum, placenta and pitultary. PACE4E-II is at least present in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      There are no restrictions on ng as its content is in no

proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.
SUBCELLUIAR LOCATION: PCSA IS SECRETED THROUGH THE REGULATED SECRETORY PATHWAY. PCSE IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH BARLY ENDOSOMES (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                      -!- DCWAIN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PAGS-1.
-! SIMILARITY: Belongs to peptidase family S8.
-!- SIMILARITY: Contains 1 homo B/P domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      InterPro; IPR0062012; Furin repeat.

pituitary and regulated by thyroid status.";

Endocrinology 135:1178-1185(1994).

-! FUNCTION: Likely to represent an endoprotease activity within the constitutive secretory pathway, with unique restricted distribution in both neuroendocrine and non-neuroendocrine tissues and capable of cleavage at the RK[K/R]R consensus motif.

-! CATALTITE CATALTITE:

proproteins by cleavage of Arg-Kaa-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.
                                                                                                                                                                                                                                                     COPACTOR: Calcium (Potential).
TISSUB SPECIFICITY: High expression in the anterior pituitary and in several brain regions, the atrium, and the ventricle DOMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -i- PUNCTION: Likely to represent a widespread endoprocease activity within the constitutive and regulated secretory pathway. Capable of Cleavage at the RX(K/R) consensus motif.
-i- CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.
-i- SUBCELLULAR LOCATION: Secreted (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=092824-1; Sequence=Displayed; 1758UB SPRCIFICITY: Expressed in T-lymphocytes. DOMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic

                tyrosine phosphate.
SUBGINIT: TETRAMEN OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: Belongs to the Tyr family of protein kinases. Insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                              INSULIN-LIKE GROWTH PACTOR I RECEPTOR,

-!- FUNCTION: Functions as a receptor for membrane-bound ligands
Jaggedl, Jagged2 and Deltal to requlate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=21331789; PubMed=11438922;

                                                                              CHAIN
       **C. -1- DEVELOPMENTAL STAGES: Expressed in the brain during E14 and E17.

-1- DEVELOPMENTAL STAGES: Expressed in the brain during E14 and E17.

-1- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertage in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(FK). Following Ilgand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentilin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

--- FTM: Phosphorylated (By similarity).

--- SIMILARITY: Contains 35 EGP-like domains.

--- SIMILARITY: Contains 2 Lin/Notch repeats.

WILLS A.F., Kurban R.R., Hovens Chain reaction to cloning members of the protein tyrosine kinase family.";

of the protein tyrosine kinase family.";

C.I. PUNCTION: THIS RECEPTOR BINDS INSULIN-LIKE GROWTH FACTOR I (IGF I)

TYROSINE-FROTENIN KINASE ACTIVITY.

C.I. CHALYTIC ACTIVITY: AND IGF II WITH A LOWER AFFINITY. IT HAS A TROSINE PROPERING FOR THE PROPERING CONTINUINTY.

C.I. CHALYTIC ACTIVITY: AND 1 SETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORWATION OF THE LIGAND-BINDING DOWAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOWAIN.

C.I. SUBCELLULAR LOCATION: Type I membrane protein.

C.I. SIMILARITY: Contains 2 fibronectin type III domains.
                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Mizutani T., Taniguchi Y., Aoki T., Hashimoto N., Honjo T.;

Conservation of the biochemical mechanisms of signal transduction

among mammalian Notch family members.

E proc. Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).

C Jaggedl, Jaggedz and Deltal to regulate cell-fate determination.

Upon ligand activation through the released notch intracellular

C domain (NICD) it forms a transcriptional activator complex with

RBP-J kappa and activates genes of the enhancer of split locus.

Affects the implementation of differentiation, proliferation and

apoptotic programs (By similarity). May play an essential role in

postimplantation development, probably in some aspect of cell

specification and/or differentiation.

-I- SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-

terminal fragment N(BC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IsoId=035516-2; Sequence=VSP_001405; Note=No experimental confirmation available; TISSUE SPECIFICITY: Expressed in the brain, liver, kidney, neuroepithelia, somites, optic vesicles and branchial arches, but

the postnatal ependymal cells, and the choroid plexus throughout embryonic and postnatal development.

FTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(BC). Following ligand binding, it is cleaved by TNP-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NEUROGENIC LOCUS NOTCH HOMOLOG PROTEIN NOTCH EXTRACELLULAR TRUNCATION.

Human; thrombospondin-30; cytostatic; anti-HIV; antiinflammatory; malignant tumour; haemopathy; HIV infection; immunological disease; (BIOR-) BIOROAD GENE DEV LTD SHANGHAI. AAB99220 standard; protein; 272 AA 27-NOV-2000; 2000WO-CN000494. 29-NOV-1999; 99CN-00124148 (first entry) Human thrombospondin-30.

Human thrombospondin-30 and polynuclectide is useful in diagnosis and treatment of, e.g., malignant tumor, hemopathy, HIV infection, immunological diseases and various inflammatory diseases.

Claim 1; Page 27-28; 33pp; Chinese.

The present sequence is the protein sequence for human thrombospondin-30. Thrombospondin-30 protein and coding sequence are useful in the diagnosis and treatment of mailgnant tumour. haemopathy, HIV infection, immunological diseases and various inflammation diseases. In addition thrombospondin-30 protein may be used for screening mimics, agonists, antagonists or inhibitors, or for use in peptide fingerprinting identification. The thrombospondin-30 coding sequence may be used as primers for nucleic acid amplification reaction or as probes for hybridisation reaction, or in producing gene chips or microarrays

encoded polypeptides (AAMY8323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAKS2SB1), 2111 (AAKS2SB2) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

The patent discloses novel stem cell growth factor-like proteins and polymucleotides encoding them. Proteins of the invention are also known as supporting factor for the proliferation of stem cells (SCR-1). Stem cell growth factor-like proteins are useful for supporting proliferation or survival of a stem cell or germ cell which is preferably primordial germ cell, germ line stem cell, embryonic stem cell, haematopoietic stem cell, haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell cultured using stem cell growth factor-like proteins can replace as a graft for the bone marrow transplantation or cord blood transplantation for treating a variety of diseases such as immunodeficiency syndrome, chronic granulomatous
                                                                                                                                                                                                                                                                                                                                    Novel stem cell growth factor like polypeptides and polynucleotides for identifying modulators useful for treating diseases such as Alzheimer's disease, cancer, rheumatoid arthritis, osteoporosis.
                                                                                                                                                                                                                                  Tang TY, Labat I, Tillinghast JS, Sinku A, Liu C,

The patent discloses novel stem cell growth factor-like proteins and polynucleotides encoding them. Proteins of the invention are also known as supporting factor for the proliferation of stem cells (SCR-1). Stem cell growth factor-like proteins are useful for supporting proliferation or survival of a stem cell or germ cell which is preferably primordial germ cell, germ line stem cell, embryonic stem cell, haematopoietic stem cell, haematopoietic progenitor cell, puripotent cell or totipotent cell. The haematopoietic progenitor cell cultured using stem cell growth factor-like proteins can replace as a graft for the bone marrow

transplantation or cord blood transplantation for treating a variety of diseases such as immunodeficiency syndrome, chronic granulomatous clienaes, duplicated immunodeficiency syndrome, agammaglobulinaemia, wiskort.Aldrich syndrome, acquired immuno deficiency syndrome (AIDS), thalassaemia, haemolytic anaemia due to enzyme defect, congenital anaemia cuch as sickle cell anaemia, Gaucher's disease, lysosomal storage diseases such as mucopolysaccharidosis, adrenal white matter degeneration, a variety of cancer and tumours. Proteins of the invention crate useful for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, thrombocytopaenia, immune cate and other neurodegenerative diseases, thrombocytopaenia, immune deficiencies and disorders such as sultiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, and autoimmune pulmonary inflammation. Sequences of the invention are also useful in gene therapy.

The present sequence is stem cell growth factor-like protein from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 LFFALERIGAKQIGVCLSSCPSGYYGTRYPDINKCTKCKADCDTCFNKNPCTKCKSGFYL 120

The invention relates to new stem cell growth factor-like polypeptides and polynucleotides. The stem cell growth factor-like polypeptides and polynucleotides are useful for inducing differentiation of embryonic and adult stem cells to give rise to different cell types, for treating e.g. cannit stem cells to give rise to different cell types, for treating e.g. leukaemia, haemophilia and degenerative diseases like Alzheimer's compared to the polynucleotides are set of disease. They are also useful for generating one tissues and organs that compared to a partial as hybridisation probes, oligomers or primers for PCR, for useful as hybridisation probes, oligomers or primers for PCR, for chromosome and gene mapping, in recombinantly producing protein, in comparating antisense DNA or RNA, in diagnostics as expressed sequence tags for identifying expressed genes, and for inducing immune response. The polypeptides are useful for generating antibodies that specifically bind the polypeptide, as molecular weight markers, and as a food supplement (e.g. protein or amino acid supplement, and as a carbon, nitrogen or carbohydrate source). Compositions comprising the current cor prevention of cancers, and other immunological disorders. The current expensents a human clone I thrombospondin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The invention relates to an isolated stem cell growth factor-like polypeptide (referred as supporting factor for proliferation of stem cells (SCR-1)) from mouse or human, or its mature protein portion, or fragment, analogue, variant or derivative, that retains stem cell growth factor activity. Also included are an isolated polymucleotide encoding SCR-1 for its mature protein portion, or fragment, analogue, variant or scrivity. Also included are an isolated polymucleotide encoding CSCR-1 polymucleotide, a polymucleotide, and stem contain the SCR-1 polymucleotide, a most cell growth a regulatory sequence CSCR-1 polymucleotide in operative association with a regulatory sequence CSCR-1 polymucleotide in operative association with a regulatory sequence CSCR-1 polymucleotide in polypeptide which is an controls expression product of the polymucleotide (the polypeptide which is an contivity to support proliferation or survival of haematopoietic stem cell comparise the as sequence appearing as ABCA4433), and contained and sequence does not comparise the as sequence appearing any 10 consecutive as from ABCA4430, an isolated polypeptide on an an abcarage of lacking any 10 consecutive as from ABCA4430, an isolated polypeptide comparise the sequence comprising the SCR-1 polymucleotide or a unique segment of the SCR-1 polymucleotide or a unique segment of the SCR-1 polymucleotide or a unique segment of polypeptide attached to a surface, a stromal cell genetically engineered to express the SCR-1 polymucleotide or a unique segment of polymetically engineered to express the SCR-1 polymucleotide or a unique segment of polymetically engineered to express the SCR-1 polymothedicide or a unique segment of polymetically engineered to express the SCR-1 polymothedicide or a unique segment of polymetically engineered to express the SCR-1 polymothedicide or a unique segment of the SCR-1 polymothedic attached to a surface, a strome cell or gene cell
                                                                                                                                                                                   /note= "Mature stem cell growth factor-like protein. This protein is specifically claimed in claim 9°
epithelial cell growth; ovarian follicle development; nerve cell growth; cartilage remodeling; bone growth; immunosuppression; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated polypeptide having stem cell growth factor activity, useful for promoting wound healing, and as a medicine to proliferate or support human hematopoietic stem cells or human hematopoietic progenitox

healing. The human haematopoietic stem cell or human haematopoietic progenitor cell culture using the SCR-1 polypeptide can replace as a graft for the conventional bone marrow transplantation or cord blood transplantation. The transplantation of haematopoietic stem cells can be employed as a therapy for treating diseases such as chronic granulomatous diseases, duplicated immunodeficiency syndrome, agammaglobulinaemia, wiskott-Aldrich syndrome, ALDS, etc., thalassaemia, haemolytic anaemia due to enzyme defect, congenital anaemia such as sicklaemia, Gaucher's disease etc. the SCR-1 polypeptide is useful for cell growth and morphogenesis, including tissue specific stem cell growth, epithelial cell growth, sustaining neuronal populations, cartilage remodeling, bone growth, and immunosuppression. The present sequence is a Human SCR-1
                                                                                                                                                                                                                                                                                                                                                                                             ö
